

ABSTRACT

The present invention relates to a risk bid market system which eliminates the potential for front running and information leakage. This system includes
5 a computer system for hosting software bidding modules, each bidding module maintained by a bidder. The system also includes a interface through which a client submits information to the computer regarding a portfolio or a block order. The system further
10 includes a communication link for communicating in real time data from the plurality of bidders to their respective bidding modules. The information provided by the client to the computer cannot be communicated to the bidders through the communication means, thereby
15 isolating that information from the bidders.
